### 1 Firewall Basic Syntax

Our firewall model supports the following actions.

 $\label{eq:datatype} \textbf{datatype} \ \textit{action} = \textit{Accept} \mid \textit{Drop} \mid \textit{Log} \mid \textit{Reject} \mid \textit{Call string} \mid \textit{Return} \mid \textit{Empty} \mid \textit{Unknown}$ 

The type parameter  $^{\prime}a$  denotes the primitive match condition For example, matching on source IP address or on protocol. We list the primitives to an algebra. Note that we do not have an Or expression.

```
match-expr 'a match-expr | MatchAny
datatype-new 'a rule = Rule (get-match: 'a match-expr) (get-action: action)
datatype-compat rule
datatype final-decision = FinalAllow \mid FinalDeny
The state during packet processing. If undecided, there are some remaining
rules to process. If decided, there is an action which applies to the packet
datatype state = Undecided \mid Decision final-decision
end
theory Misc

begin
```

 $datatype 'a match-expr = Match 'a \mid MatchNot 'a match-expr \mid MatchAnd 'a$ 

#### 2 Big Step Semantics

The assumption we apply in general is that the firewall does not alter any packets.

```
type-synonym 'a ruleset = string \rightharpoonup 'a rule list

type-synonym ('a, 'p) matcher = 'a \Rightarrow 'p \Rightarrow bool

fun matches :: ('a, 'p) matcher \Rightarrow 'a match-expr \Rightarrow 'p \Rightarrow bool where

matches \gamma (MatchAnd e1 e2) p \longleftrightarrow matches \gamma e1 p \land matches \gamma e2 p
```

```
matches - MatchAny - \longleftrightarrow True
inductive iptables-bigstep :: 'a ruleset \Rightarrow ('a, 'p) matcher \Rightarrow 'p \Rightarrow 'a rule list \Rightarrow
state \Rightarrow state \Rightarrow bool
   (-,-,-\vdash \langle -, - \rangle \Rightarrow - [60,60,60,20,98,98] 89)
   for \Gamma and \gamma and p where
skip: \Gamma, \gamma, p \vdash \langle [], t \rangle \Rightarrow t \mid
accept: matches \gamma m p \Longrightarrow \Gamma, \gamma, p \vdash \langle [Rule \ m \ Accept], \ Undecided \rangle \Rightarrow Decision
FinalAllow |
               matches \gamma m p \Longrightarrow \Gamma, \gamma, p \vdash \langle [Rule \ m \ Drop], \ Undecided \rangle \Rightarrow Decision \ Fi-
nalDeny \mid
reject: matches \gamma m p \implies \Gamma, \gamma, p \vdash \langle [Rule \ m \ Reject], \ Undecided \rangle \Rightarrow Decision
FinalDeny |
              matches \ \gamma \ m \ p \Longrightarrow \Gamma, \gamma, p \vdash \langle [Rule \ m \ Log], \ Undecided \rangle \Rightarrow Undecided \mid
log:
empty: matches \gamma m p \Longrightarrow \Gamma, \gamma, p \vdash \langle [Rule \ m \ Empty], \ Undecided \rangle \Longrightarrow Undecided \mid
nomatch: \neg matches \gamma m p \Longrightarrow \Gamma, \gamma, p \vdash \langle [Rule\ m\ a],\ Undecided \rangle \Longrightarrow Undecided \mid
decision: \Gamma, \gamma, p \vdash \langle rs, Decision X \rangle \Rightarrow Decision X \mid
              \llbracket \Gamma, \gamma, p \vdash \langle rs_1, Undecided \rangle \Rightarrow t; \Gamma, \gamma, p \vdash \langle rs_2, t \rangle \Rightarrow t' \rrbracket \Longrightarrow \Gamma, \gamma, p \vdash \langle rs_1@rs_2, t \rangle
Undecided \rangle \Rightarrow t'
call-return: \llbracket matches \ \gamma \ m \ p; \ \Gamma \ chain = Some \ (rs_1@[Rule \ m' \ Return]@rs_2);
                         matches \ \gamma \ m' \ p; \ \Gamma, \gamma, p \vdash \langle rs_1, \ Undecided \rangle \Rightarrow Undecided \parallel \Longrightarrow
                      \Gamma, \gamma, p \vdash \langle [Rule\ m\ (Call\ chain)],\ Undecided \rangle \Rightarrow Undecided \mid
call-result: \llbracket matches \gamma m p; \Gamma chain = Some rs; \Gamma, \gamma, p \vdash \langle rs, Undecided \rangle \Rightarrow t \rrbracket
                      \Gamma, \gamma, p \vdash \langle [Rule\ m\ (Call\ chain)],\ Undecided \rangle \Rightarrow t
```

The semantic rules again in pretty format:

 $matches \ \gamma \ (MatchNot \ me) \ p \longleftrightarrow \neg \ matches \ \gamma \ me \ p \ |$ 

 $matches \ \gamma \ (Match \ e) \ p \longleftrightarrow \gamma \ e \ p \ |$ 

```
\neg matches \gamma m p
                        \Gamma, \gamma, p \vdash \langle [Rule\ m\ a],\ Undecided \rangle \Rightarrow Undecided
                              \Gamma, \gamma, p \vdash \langle rs, Decision X \rangle \Rightarrow Decision X
                 \Gamma, \gamma, p \vdash \langle rs_1, Undecided \rangle \Rightarrow t
                                                                     \Gamma, \gamma, p \vdash \langle rs_2, t \rangle \Rightarrow t'
                                 \Gamma, \gamma, p \vdash \langle rs_1 @ rs_2, Undecided \rangle \Rightarrow t'
                                      \Gamma chain = Some (rs<sub>1</sub> @ [Rule m' Return] @ rs<sub>2</sub>)
    matches \gamma m p

```

## 7 Packet Matching in Ternary Logic

```
The matcher for a primitive match expression 'a
```

```
type-synonym ('a, 'packet) exact-match-tac='a \Rightarrow 'packet \Rightarrow ternaryvalue
```

If the matching is *TernaryUnknown*, it can be decided by the action whether this rule matches. E.g. in doubt, we allow packets

```
type-synonym 'packet unknown-match-tac=action \Rightarrow 'packet \Rightarrow bool
```

```
type-synonym ('a, 'packet) match-tac=(('a, 'packet) exact-match-tac <math>\times 'packet unknown-match-tac)
```

For a given packet, map a firewall 'a match-expr to a ternaryformula Evaluating the formula gives whether the packet/rule matches (or unknown).

```
fun map-match-tac :: ('a, 'packet) exact-match-tac \Rightarrow 'packet \Rightarrow 'a match-expr \Rightarrow ternaryformula where
map-match-tac \beta p (MatchAnd m1 m2) = TernaryAnd (map-match-tac \beta p m1) (map-match-tac \beta p m2) |
```

```
map-match-tac \beta p (MatchNot m) = TernaryNot (map-match-tac \beta p m) | map-match-tac \beta p (Match m) = TernaryValue (\beta m p) | map-match-tac - MatchAny = TernaryValue TernaryTrue
```

the ternaryformulas we construct never have Or expressions.

```
fun ternary-has-or :: ternaryformula \Rightarrow bool where

ternary-has-or (TernaryOr - -) \longleftrightarrow True |

ternary-has-or (TernaryAnd t1 t2) \longleftrightarrow ternary-has-or t1 \lor ternary-has-or t2 |

ternary-has-or (TernaryNot t) \longleftrightarrow ternary-has-or t |

ternary-has-or (TernaryValue -) \longleftrightarrow False

lemma map-match-tac-does-not-use-TernaryOr: \neg (ternary-has-or (map-match-tac \beta p m))
```

```
fun tomam to had unly own match to a "market unly own match to a action -
```

```
fun ternary-to-bool-unknown-match-tac :: 'packet unknown-match-tac \Rightarrow action \Rightarrow 'packet \Rightarrow ternaryvalue \Rightarrow bool where ternary-to-bool-unknown-match-tac - - - TernaryTrue = True | ternary-to-bool-unknown-match-tac - - - TernaryFalse = False | ternary-to-bool-unknown-match-tac \alpha a p TernaryUnknown = \alpha a p
```

Matching a packet and a rule:

 $\mathbf{by}(induction\ m,\ simp-all)$ 

- 1. Translate 'a match-expr to ternary formula
- 2. Evaluate this formula
- 3. If TernaryTrue/TernaryFalse, return this value
- 4. If Ternary Unknown, apply the 'a unknown-match-tac to get a Boolean result

```
definition matches :: ('a, 'packet) \ match-tac \Rightarrow 'a \ match-expr \Rightarrow action \Rightarrow 'packet
\Rightarrow bool \text{ where}
 matches \ \gamma \ m \ a \ p \equiv ternary-to-bool-unknown-match-tac \ (snd \ \gamma) \ a \ p \ (ternary-ternary-eval

# 10 Boolean Matching vs. Ternary Matching

term Semantics.matches
term Matching-Ternary.matches

The two matching semantics are related. However, due to the ternary logic, we cannot directly translate one to the other. The problem are MatchNot expressions which evaluate to TernaryUnknown because MatchNot TernaryUnknown and TernaryUnknown are semantically equal!

```
lemma \exists m \beta \alpha a. Matching-Ternary.matches (\beta, \alpha) m a p \neq
 Semantics.matches (\lambda atm p. case \beta atm p of TernaryTrue \Rightarrow True | TernaryFalse
\Rightarrow False | TernaryUnknown \Rightarrow \alpha a p) m p
apply(rule-tac \ x=MatchNot \ (Match \ X) \ in \ exI) \longrightarrow any \ X

 normalized-match (MatchNot\ (Match -)) = True
 normalized-match (MatchAnd m1 m2) = ((normalized-match m1) \land (normalized-match
m2)) \mid
 normalized-match - = False
Essentially, normalized-match checks for a negation normal form: Only AND
is at toplevel, negation only occurs in front of literals. Since 'a match-expr
does not support OR, the result is in conjunction normal form. Apply-
ing normalize-match, the reuslt is a list. Essentially, this is the disjunctive
normal form.
